1. Average number of monthly transactions

With Numpy

```
df["monthly_transactions"].mean()
```

Without Numpy

```
total = 0
for value in df["monthly_transactions"]:
    total += value
average = total / len(df["monthly_transactions"])
print(average)
```

2. Total balance across all records

With Numpy

```
df["total_balance_usd"].sum()
```

Without Numpy

```
total = 0
for value in df["total_balance_usd"]:
    total += value
print(total)
```

3. Unique cities in the dataset

With Numpy

```
df["city"].unique()
```

Without Numpy

```
cities = []
for city in df["city"]:
    if city not in cities:
        cities.append(city)
print(cities)
```
